Chapter A1

Integers

A1.1 Number systems and properties of integers:

Exercise 1:

Date: _____

Complete: * Natural numbers: $N = \{1; 2; 3; 4; \dots\}$ * Whole numbers $N_0 = \{0; 1; 2; 3; \dots\}$ * Integers: $Z = \{\dots; -2; -1; 0; 1; 2; \dots\}$

The integers are expanded to include the fractions:

Rational numbers (\mathbb{Q}): Include all fractions which can be written as $\frac{a}{b}$, with a and b as integers and $b \neq 0$. This includes all finite and recurring decimal fractions.

E.g. $\frac{1}{3}$; $0.\dot{7}$; $-3\frac{5}{8}$; 2,34; $\sqrt{25}$; 9; $\sqrt[3]{27}$ etc.

Irrational numbers (\mathbb{Q}'): Includes all infinite and non-recurring decimal fractions.

E.g. 3,68463.....; π ; $\sqrt{10}$; $\sqrt[3]{4}$ etc.

Real numbers (\mathbb{R}) consist of all rational and irrational numbers in union: $\mathbb{Q} \cup \mathbb{Q}'$

Non-real numbers for example are: $\sqrt{-4}$; $\sqrt{-12}$ etc.

$\sqrt[3]{-8}$ and $\sqrt[3]{-243}$ however, are real numbers, because $\sqrt[3]{-8} = -2$ and $\sqrt[3]{-243} = -3$.

Properties of 1 and 0:

* $m \times 0 = 0$

* $m \times 1 = m$

* $0 \div m = 0$

* $m \div 1 = m$

* $m \div 0 = \text{undefined}$

Identity elements:

* 0 is the identity element of addition, because $m + 0 = m$ * 1 is the identity element of multiplication, because $m \times 1 = m$

Inverse:

* The sum of a number and its additive inverse is 0.

E.g. 3 is the additive inverse of -3, because $3 + (-3) = 3 - 3 = 0$

* The multiplicative inverse (reciprocal) is the number multiplied with a certain number with a result of 1. E.g. the multiplicative inverse of 3 is $\frac{1}{3}$, because $3 \times \frac{1}{3} = \frac{3}{1} \times \frac{1}{3} = 1$

Other properties:

* Commutative operation: $m \times n = n \times m$ or $m + n = n + m$ * Associative operation: $(m \times n) \times p = m \times (n \times p)$ or $(m + n) + p = n + (m + p)$ * Distributive operation: $p \times (m + n) = p \times m + p \times n$ or $p \times (m - n) = p \times m - p \times n$

A1.2 Rules for divisibility:

Divisor:	Rules for divisibility:
2	Last digit must be an even number or a 0.
3	Sum of all the digits must be divisible by 3.
4	Two last digits must be divisible by 4.
5	Last digit must be 5 or 0.
6	Rules for divisibility for 2 and 3 must apply.
8	Last three digits must be divisible by 8.
9	Sum of all the digits must be divisible by 9.
10	Last digit must be 0.
11	Calculate the sums of the alternate digits. The difference between these sums must be 0, or it must be divisible by 11.

E.g. 1 Determine whether 10 527 is divisible by the numbers in the above table:

2: NO, because the number (10 527) does not end on an even number.

3: YES, because the sum of the digits, $1+0+5+2+7=15$ is divisible by 3.

4: NO, because 27(10 527) is not divisible by 4.

5: NO, because the number does not end on a 5 or a 0.

6: NO, because the rule of divisibility for 2 does not apply.

8: NO, because the last three digits, 527, are not divisible by 8.

9: NO, because the sum of the digits viz. $1+0+5+2+7=15$ is not divisible by 9.

10: NO, because the last digit is not 0.

11: YES, because the difference between $1+5+7=13$ and $0+2=2$ with $13 - 2 = 11$.

Exercise 2:

4: Yes, 20 divisible by 4.	10: Yes, ends on 0.
5: Yes, ends on 0.	11: Yes, $(7+2)-(9+0)=0$.
6: Yes, divisible by 2 and 3.	

⊙ A certain number is divisible by 2, 3, 5 and 11. This number is not divisible by 8 and 9, but it is divisible by 4. Determine the smallest number that meets these conditions.

$$4 \times 3 \times 5 \times 11 = 660$$
