## Chapter C2

### Data handling

#### C2.1 Revision grade 11:

##### C2.1.1 Measurement of central tendencies:

- \* **Mode:** This is the count that occurs the **most**. With grouped data, the modal class is the class with the highest frequency.
- \* **Median:** This is the count that occurs precisely in the **middle** of the arranged data.
- \* **Mean:** The total of all the values divided by the number of entries for a specific set of data. The formula  $\bar{x} = \frac{\sum x}{n}$  with  $\bar{x}$  as the mean,  $\sum$  means the sum of,  $x$  is all the value in the data set and  $n$  is the number of entries.  
For grouped data the formula  $\bar{x} = \frac{\sum fx}{n}$  is used with  $fx$  the product of the midpoint and the frequency of each class.

##### C2.1.2 Distribution (dispersion) of data:

- \* **Range:** (Highest value – lowest value).
- \* **Median:** Divide the arranged data in two halves.
- \* **Quartiles:** Divide the arranged data in 4 quarters. Each two quarters are separated by a quartile:
  - The lower quartile ( $Q_1$ ) is between the first and second quarters.
  - The middle quartile ( $Q_2$ ) better known as the median (M) is between the second and third quarters and divide the data in two equally large sets of data.
  - The upper quartile ( $Q_3$ ) is between the third and fourth quarters.
- \* **Deciles:** Divide the arranged data in ten equal groups.  
The median is the 5<sup>th</sup> decile.
- \* **Percentiles:** Divide the arranged data in 100 equal groups.  
The median is the 50<sup>th</sup> percentile.

If there are outliers in the data, the range will not be used as a measure of dispersion of the data; then we would rather use the interquartile range (IQR). The IQR is based on the distribution of the middle half of the data around the median.

$$\therefore \text{IQR} = Q_3 - Q_1$$

### C2.1.3 Cumulative frequency:

Ex. 1 (a) Complete the following frequency table according to the pulse (per minute) of the players of the two rugby teams, after a match.  
Summarize both teams on one frequency table.

Rugby team A:	87	98	99	99	102	105	105	107	108	108	111	111
Rugby team B:	101	102	108	110	112	113	114	118	119	121	124	124
	126	126	128	129	129	130	131	133	135	135	141	

Frequency of the pulse of the rugby players:

Pulse	Frequency	Cumulative frequency	
81 - 90	1	1	Start by writing down F(1)
91 - 100	3	4	Add F(3) to the 1
101 - 110	10	14 *	Add F(10) to the 4
111 - 120	11	26	Add F(10) to the 14
121 - 130	14	39	Add F(13) to the 24
131 - 140	6	45	Add F(6) to the 37
141 - 150	1	46	Add F(1) to the 43

(b) How many of the players have a pulse of less than 111 per minute?  
Use the data in (a).

14 read from \*

### C2.1.4 Ogives:

Ex. 2 (a) Use the cumulative frequency table in ex. 1 and draw an ogive of the data.  
(b) Use the ogive to determine the median. Show on the ogive where the reading were done.

To draw the ogive:

- \* The upper boundary of each class interval is indicated on the x-axis.
- \* The y-axis is divided in units to cover the cumulative frequency.
- \* Each point dotted on the graph thus consists of the upper boundary of the class interval as x-coordinate and the cumulative frequency as y-coordinate.  
Eg. (90 ; 1) and (100 ; 4).
- \* Connect the points with a free hand.
- \* Remember to label the axis!

(b) There are 46 data entries. The median will therefore lie between entries 23 and 24. Therefore, go to the cumulative entry of 23, 5 on the y-axis and from there read the median from the x-axis.

∴ Median = 117 at A

## C2.1.5 Variance and standard deviation:

### C2.1.5.1 Without calculator:

Ex.3 The number of cars sold (per month) in one calendar year by the sales consultants of a certain car dealer is as follow:

23 32 11 34 16 14 27 12 17 18 29 19

(a) Determine the monthly mean number of cars sold by the car dealer for this year.

$$\bar{x} = \frac{11 + 12 + 14 + 16 + 17 + 18 + 19 + 23 + 27 + 29 + 32 + 34}{12} = \frac{252}{12} = 21$$

(b) Complete the table below:

Number of cars sold ( $x$ )	$(x_i - \bar{x})$	$(x_i - \bar{x})^2$
11	$11 - 21 = -10$	100
12	$12 - 21 = -9$	81
14	$14 - 21 = -7$	49
16	$16 - 21 = -5$	25
17	$17 - 21 = -4$	16
18	$18 - 21 = -3$	9
19	$19 - 21 = -2$	4
23	$23 - 21 = 2$	4
27	$27 - 21 = 6$	36
29	$29 - 21 = 8$	64
32	$32 - 21 = 11$	121
34	$34 - 21 = 13$	169
	$\sum_{i=1}^n (x_i - \bar{x})^2 =$	678

(c) Determine the variance of the number of cars sold.

$$\text{Variance} = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{12} = \frac{678}{12} = 56,5$$

(d) Determine the standard deviation of the number of cars sold.

$$\text{Standard deviation}(\sigma) = \sqrt{\text{Variance}} = \sqrt{56,6} \approx 7,52$$

(e) By using the standard deviation, calculated in (d), make a statement regarding the sales tactics of the consultants.

7 of the monthly sales figures of the consultants lie within the standard deviation of 7,52 of the mean. The sales figures of the consultants lie close to the mean. The team of consultants had consistent sales for the year.

### C2.1.5.2 With calculator:

Steps if using the CASIO fx-82 ZA Plus II scientific calculator:

\* Press Mode 2(STAT)

\* Press 1(VAR)

\* Screen:  $x$

1

2

3

→ Key in the values followed by =

\* Press AC to clear the screen

\* Press Shift 1 – STAT option appears on the screen

\* Press 4(VAR) – VAR option appears on the screen

\* Press 2( $\bar{x}$ ) = for the mean

\* Press Shift 1 – STAT option appears on the screen

\* Press 4(VAR) – VAR option appears on the screen

\* Press 3( $\sigma x$ ) = Standard deviation

Example:

21 ; 24 ; 27 ; 32

21 = 24 = 27 = 32 =

26

4,06201 ...  $\approx$  4,06

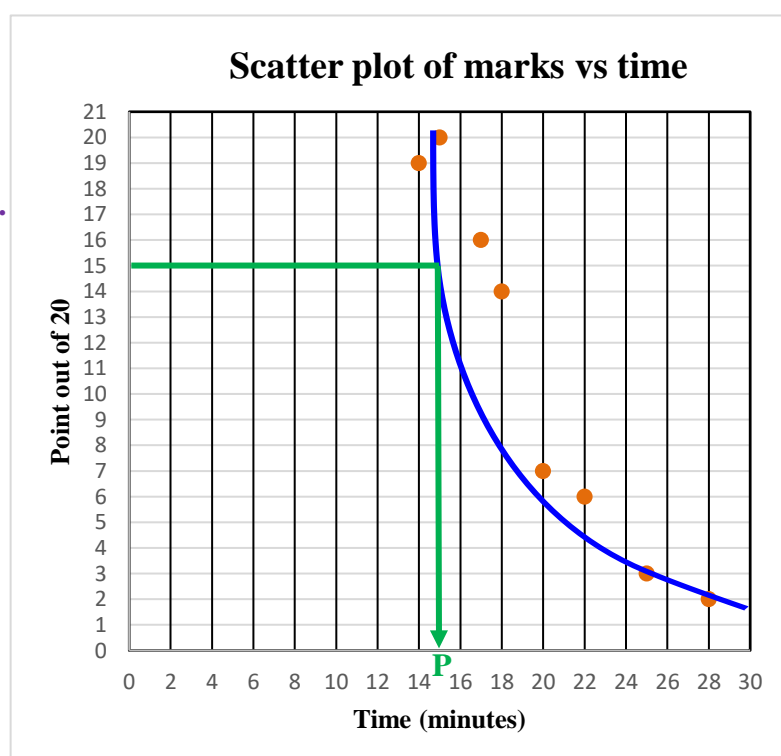

Use the data in example 3 to calculate the standard deviation ( $\sigma$ ) by using the calculator.

### C2.1.6 Scatter plots:

Ex. 4 A group of students write a test at the end of a topic. The test consists out of 20 multichoice questions. It appears as if the students who studied harder for the test, answers the test quicker. The table below shows the time and marks for each student:

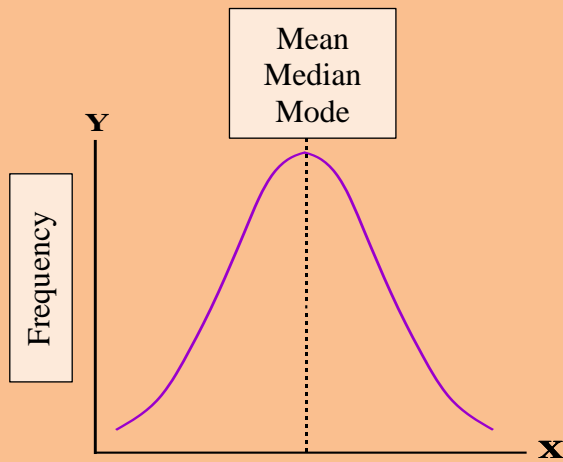

Student:	A	B	C	D	E	F	G	H
Time (in minutes):	25	20	18	22	15	17	28	14
Mark out of 20:	3	7	14	6	20	16	2	19

- (a) Draw a scatter plot to represent the information in the table.
- (b) Draw the line of best fit on the graph.
- (c) Describe the correlation between the marks and the time according to the line of best fit.
- (d) Predict the time that a student scoring 15 out of 20 will take to complete the test.
- (b) See graph in blue
- (c) Exponential correlation
- (d) At P: it can take about 15 minutes to score a of 15 out of 20.

## C2.1.7 Analysis of distribution:

### Symmetrical distribution:

→  $\text{Mean} - \text{Median} = 0$

### Distribution negative skew:

→  $\text{Mean} - \text{Median} < 0$

→ **Negative skew to the left**

### Distribution positive skew:

→  $\text{Mean} - \text{Median} > 0$

→ **Positive skew to the right**

**Ex. 5** Two universities require a Mathematics-entrance examination for prospective first year students. Renata took the entrance examination at both universities. The normal distribution graph below represents the results for University A.

\* University B announced the following:

Mean ( $\bar{x}$ ) = 49

Standard deviation ( $\sigma$ ) = 5

(a) Calculate the standard deviation for the entrance examination of University A.

$$\sigma = \frac{90 - 65}{2} = 12,5$$

(b) Renata's results were as follow:

University A: 78

University B: 60

In which entrance examination did she achieve better marks in comparison to the other students who also wrote the test? Motivate your answer with relevant calculations.

University A:  $78 - 65 = 13$  - See graph!

Her results lie somewhat more than one standard deviation from the mean.

University B: See at \*!

$$\bar{x} + \sigma = 49 + 5 = 54$$

$$\bar{x} + 2\sigma = 49 + 10 = 59$$

Her results lie somewhat more than two standard deviations from the mean.

**$\therefore$  Her percentage was better at University B in comparison to the other students.**

Exercise 1:

Date: \_\_\_\_\_

(1) Calculate the mean ( $\bar{x}$ ) and the standard deviation ( $\sigma$ ) of each of the following sets of data by using the calculator: [Give your answer correct to one decimal.]

(a) 18 ; 24 ; 36 ; 11 ; 24

\_\_\_\_\_

(b) 312 ; 203 ; 254 ; 215 ; 456 ; 300

\_\_\_\_\_

(c) 3 ; 2 ; 8 ; 10 ; 4 ; 3 ; 3 ; 4 ; 5 ; 3

\_\_\_\_\_

(d) 3 380 ; 3 456 ; 3 654 ; 3 020

\_\_\_\_\_

(e) 44 ; 32 ; 56 ; 37 ; 65 ; 33 ; 40

\_\_\_\_\_

(2) The number of SMS messages sent by a group of teenagers was recorded over a period of a week. The data was found to be normally distributed with a mean of 140 messages and a standard deviation of 12 messages.

Answer the following questions with reference to the information provided in the graph:

(a) What percentage of teenagers sent less than 128 messages?

\_\_\_\_\_

(b) What percentage of teenagers sent between 116 and 152 messages?

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

- (4) A farmer makes use of piece workers to harvest vegetables. He aims to harvest two hectares daily. The table below shows the number of workers versus the total number of hours it takes the workers to harvest the two hectares of vegetables daily:

Day	1	2	3	4	5	6	7	8	9
Number of hours	4	12	8	6	9	10	12	4	5
Number of workers	36	13	16	24	15	14	36	40	28

- (a) Determine the median for the number of hours worked.

---

---

---

- (b) Determine the median for the number of workers.

---

---

---

- (c) Present the data in the table as a scatter plot. Show the median clearly on the graph. Mark the median with an M.

- (d) Would the line of best fit be best described as a linear, quadratic or exponential curve for above information?

---

---

- (e) Calculate the mean number of hours per day worked by the workers for this specific period.

---

---

- (f) Use a calculator and calculate the variance and standard deviation of the number of hours worked per day by the workers.

---

---

---

- (5) The following table shows the number of cars, according to the make, offered by a secondhand dealer:

<b>Make:</b>	<b>Number sedans:</b>	<b>Number bakkies:</b>	<b>Frequency:</b>
Fiat	12	4	
Ford	8		15
Mazda		10	18
Nissan	5	7	
Opel	16	2	
Tata	18		26
Toyota		3	6
Volkswagen	7	2	
TOTAL			

- (a) Complete the table.
- (b) Is this data discrete or continuous? Motivate your answer.

---

- (c) Present the table as a pie chart. Show all calculations.

---

---

---

---

(d) Present the the number of sedans available in the different models as a bar chart.

(e) Present the the number of bakkies available in the different models as a line graph.

(6) The following is the heights, to the nearest cm, of all the girls in grade 8:

141 145 176 165 156 137 169 176 155 187 156 153 161 163 156 155 161  
150 159 177 148 155 160 145 168 149 167 169 157 171 166 156 161 169  
170 169 163 172 188 139 169 167 155 153 149 166 178 155 168 181 177

(a) Is this data discrete or continuous? Motivate your answer.

---

(b) Is this data quantitative or qualitative? Motivate your answer.

---

- (c) Use the data and complete the table below and draw an ogive of the data in the table:

Heights in cm:	Tally:	Frequency (F):	Cumulative F:	Points to plot:
131 – 140				
141 – 150				
151 – 160				
161 – 170				
171 – 180				
181 – 190				

- (d) Indicate on the ogive where the reading for the median will be done. What is the median?

- (e) Determine the modal class. \_\_\_\_\_

- (f) Present the data as a stem-and-leave diagram.

- (g) Use the the stem-and-leave diagram in (f) and determine the median. Compare this median with the median determined in (d).

---

- (h) Use the the stem-and-leave diagram in (f) and determine the median. Compare this median with the median determined in (d).

---

## C2.2 Regression line:

To examine the relationship between two variables we use a scatter plot. The independent variable (is not influenced by other variables), is shown on the  $x$ -axis. The dependent variable (it is this variable's outcome that is examined), is shown on the  $y$ -axis. The line of best fit (as studied in previous grades) is also known as the linear regression line. If the points all lie in a perfect straight line, the line is defined by  $y = bx + a$ . If the points are spread out but have the general tendency of a straight line, the line is known as a regression line with equation  $\hat{y} = a + bx$ .

To accurately calculate the equation of the regression line (thus not by inspection), we make use of the least squares method.

### C2.2.1 Regression line – without a calculator:

To calculate the equation of the regression line ( $\hat{y} = a + bx$ ), without a calculator, we proceed as follow:

- \* Calculate the mean of all the  $x$ -values ( $\bar{x}$ ) as well as the mean of all the  $y$ -values ( $\bar{y}$ ).
- \* Set up a table as in example 6 below and complete the table.
- \* Calculate the sum of  $(x - \bar{x})(y - \bar{y})$  and the sum of  $(x - \bar{x})^2$ .
- \* Substitute the values of  $\sum(x - \bar{x})(y - \bar{y})$  and  $\sum(x - \bar{x})^2$  in the gradient formula to calculate  $b$ .
- \* Use the equation,  $\hat{y} = a + bx$  to calculate the value of  $a$ .
- \* Write the equation in standard form.

**Ex. 6 Determine the equation of the regression line of the following set of data:**

$x$	23	28	29	36	37	45
$y$	56	73	81	103	111	119

$x$	$y$	$(x - \bar{x})$	$(y - \bar{y})$	$(x - \bar{x})(y - \bar{y})$	$(x - \bar{x})^2$
23	56	-10	-34,5	345	100
28	73	-5	-17,5	87,5	25
29	81	-4	-9,5	38	16
36	103	3	12,5	37,5	9
37	111	4	20,5	82	16
45	119	12	28,5	342	144
$\sum x = 198$	$\sum y = 543$	$\sum = 0$	$\sum = 0$	$\sum = 932$	$\sum = 310$
$\bar{x} = 33$	$\bar{y} = 90,5$				

$$\therefore b = \frac{\sum(x-\bar{x})(y-\bar{y})}{\sum(x-\bar{x})^2} = \frac{932}{310} = 3,00645 \dots \approx 3 \text{ correct to two decimals.}$$

With  $\hat{y} = a + bx$

$$\therefore 90,5 = a + 3 \times 33 \rightarrow \text{Substitute } \bar{x} = 33 ; \bar{y} = 90,5 \text{ and } b = 3,00645 \dots \text{ in.}$$

$$\therefore 90,5 = a + 3,00645 \dots \times 33$$

$$\therefore a = -8,712 \dots \approx -8,71$$

$$\therefore \hat{y} = -8,71 + 3x$$

### **C2.2.2 Regression line – with a calculator:**

To calculate the equation of the regression line ( $\hat{y} = a + bx$ ), with a calculator (CASIO fx-82 ZA PLUS II), we proceed as follow:

- \* Press Mode → 2: STAT
- \* Press 2: A + BX
- \* Key in the  $x$ -values and press = after each  $x$ -value.
- \* Move the marker to the right and then to the top and key in the  $y$ -values. Remember the =.
- \* Press AC to clear the screen.
- \* Press Shift 1 and then 5:Reg
- \* Press 1:A = to determine  $a$ .
- \* Press AC Shift 1 then 5 and then 2:B = to determine  $b$ .
- \* Write the equation in standard form.

**Verify example 6 by using your calculator!**

### **C2.2.3 Correlation coefficient – with a calculator:**

The correlation coefficient ( $r$ ) is a measure of the strength of a linear relationship between two variables presented on a scatter plot. The correlation coefficient can vary between  $-1$  and  $1$ . The closer the correlation coefficient is to  $1$ , the stronger the correlation between the variables will be to perfectly positive and the closer the correlation coefficient is to  $-1$ , the stronger the correlation between the variables will be to perfectly negative. If the correlation coefficient is  $0$ , then there will be no correlation between the two variables.

To calculate the correlation coefficient ( $r$ ) by using a calculator (CASIO fx-82 ZA PLUS II) we proceed as follow:

[All the steps as to calculate the equation of the regression line.]

[Therefore, after calculating the regression line, directly going on to calculate the correlation coefficient – last step.]

- \* Press Mode → 2: STAT
- \* Press 2: A + BX
- \* Key in the  $x$ -values and press = after each  $x$ -value.
- \* Move the marker to the right and then to the top and key in the  $y$ -values. Remember the =.
- \* Press AC to clear the screen.
- \* Press Shift 1 and then 5:Reg
- \* Press 1:A = to determine  $a$ .
- \* Press AC Shift 1 then 5 and then 2:B = to determine  $b$ .
- \* **Press AC Shift 1 and then 5 and then 3: $r$  = to determine  $r$ .**

**Ex. 7 Determine the correlation coefficient by using a calculator and interpret the strength of the correlation between  $x$  and  $y$  in example 6.**

**$r \approx 0,97 \rightarrow$  There is a very strong correlation between  $x$  and  $y$  in example 6.**
