A.1.2 RULES OF DIVISIBILITY:

<p><u>Divisible by '2'</u> All numbers ending on an even number or '0' are divisible by '2' EXAMPLE: '3 458' The number ends on an '8' and is therefore divisible by '2'.</p>	<p><u>Divisible by '5'</u> All numbers ending on a '0' or a '5' are divisible by '5' EXAMPLE: '9 785' The number ends on a '5' and is therefore divisible by '5'.</p>	<p><u>Divisible by '10'</u> All numbers ending on a '0' are divisible by '10'. EXAMPLE: '2 040' The number ends on a '0' and is therefore divisible by '10'.</p>
<p><u>Divisible by '3'</u> If the sum of all the digits of the number is divisible by '3' then the number will be divisible by '3' EXAMPLE: '351' The sum of the digits in the number '351', $3 + 5 + 1 = 9$, which is divisible by 3, the entire number is divisible by '3'</p>	<p><u>Divisible by '4'</u> If the last 2 digits of a number are divisible by '4' then the entire number will be divisible by '4'. Also look out for numbers with a double zero at the end. EXAMPLE: '336' The '36' in the number '336' is divisible by '4' and the entire number will therefore be divisible by '4'.</p>	<p><u>Divisible by '6'</u> If a number is divisible by '2' and '3' then the number will be divisible by '6'. EXAMPLE: '258' The number '258' is divisible by '2' and '3' and is therefore divisible by '6'.</p>

ADDITION

A method to improve your mental maths.

(1) Add the tens and then the ones.

Write your answer in the space.

Write the final answer.

HINT:
Start by adding the larger numbers first.
(Addition is commutative)

		Answer of tens	Answer of ones	Final answer.
Example:				
(a)	$16 + 12 + 14 + 36 + 29 + 45 =$	120	32	152
(b)	$11 + 21 + 12 + 11 + 32 + 23 =$	100	10	110
(c)	$12 + 21 + 32 + 44 + 12 + 11 =$	120	12	132

(e)	$14 + 14 + 12 + 15 + 32 + 24 =$	90	21	111

(2) Do the same. Start with the hundreds.

		Answer of hundreds	Answer of tens	Answer of ones	Final answer
Example:					
(a)	$123 + 241 + 135 + 420 =$	800	110	9	919
(b)	$315 + 211 + 612 + 120 =$	1200	50	8	1 258
(c)	$215 + 122 + 232 + 421 =$	900	80	10	990
(d)	$612 + 224 + 108 + 421 =$	1300	50	15	1 365

You can use the constant function on your calculator to determine the multiples.

A1.6 Prime numbers:

A **prime** number can only be divided by 1 and itself. (Numbers with only 2 factors)

E.g. 2 ; 3 ; 5 ; 7 ; 11 ; 13 ; 17 ; 19 etc.

Numbers with more than 2 factors are called **composite numbers**.

Factors which are prime numbers are called **prime factors**.

Prime factors can be determined by using a factor tree:

$$\therefore 3 \times 2 \times 2 \times 2 \times 2 = 48$$

Prime factors: 2 and 3

$$\therefore 7 \times 2 \times 3 = 42$$

Prime factors: 2, 3 and 7

Exercise 7:

Date: _____

Draw factor trees to determine the prime factors of the following numbers

Prime factors of: 3

Prime factors of 12: 2; 3

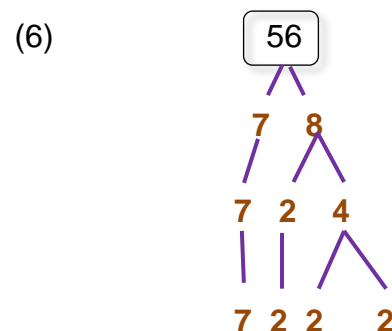

Prime factors of 16: 2

Prime factors of 20: 2; 5

Prime factors of 24: 2; 3

Prime factors of 56: 2; 7

Prime factors of 32: 2 Prime factors of 50: 2; 5

A1.7 Properties of "1" and "0":

Exercise 8:

Date: _____

(1) Complete the correct numbers on the right-hand side.

(2) Answer the following questions:

- (a) What is the outcome if you add 0 to a number? The number stays the same
- (b) What is the outcome if you subtract 0 from a number? The number stays the same
- (c) What is the outcome if you multiply a number by 1? The number stays the same
- (d) What is the outcome if you divide a number by 1? The number stays the same
- (e) What is the outcome if you multiply a number by 0?

'0'.

WHEN WILL THE VALUE OF A NUMBER REMAIN THE SAME?

Any number + 0 Any number - 0 Any number x 1 Any number ÷ 1

IDENTITY ELEMENTS:

The identity element of multiplication and division is 1

The identity element of addition and subtraction is 0

(3) Write the following answers:

- (a) $6 + 0 = \underline{6}$ (b) $5 - 0 = \underline{5}$ (c) $7 \times 0 = \underline{0}$
 (d) $6 \div 1 = \underline{6}$ (e) $7 \times 1 = \underline{7}$ (f) $9 + 0 = \underline{9}$
 (g) $3 \times 1 = \underline{3}$ (h) $1 \times 1 = \underline{1}$ (i) $6 \div 1 = \underline{6}$
 (j) $6 - 6 + 8 = \underline{8}$ (k) $4 + 8 - 8 = \underline{4}$ (l) $a + 4 - 4 = \underline{a}$
 (m) $2 - 2 + k = \underline{k}$ (n) $5 + 4 - 4 = \underline{5}$ (o) $10 + 5 - 1 - 3 = \underline{11}$

(4) Check the following by using inverse operations:

$3 + 4 = 7$	therefore	$7 - 4 = 3$
$12 - 7 = 5$	therefore	$5 + 7 = 12$
$3 \times 4 = 12$	therefore	$12 \div 4 = 3$
$0 \div 6 = 0$	therefore	$0 \times 6 = 0$
BUT		
$3 \div 0 = \square$	and	$0 \times \square = 3$ (<i>Impossible!</i>)
Therefore, dividing by '0' is undefined.
