## Chapter C1

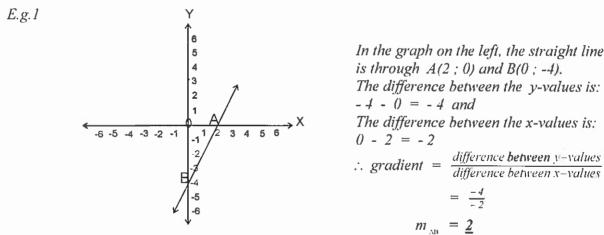

### **Analytical geometry**

#### C1.1 Gradient:

#### C1.1.1 Calculating the gradient:

In grade 10 the following formula for the gradient of the straight line were derived:

E.g.2 Calculate the gradient of the line through the following points: M(2; -1) and N(-2; 3)\*\*\*\*\*\*\*

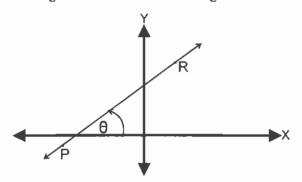

$$m_{M} = \frac{y_{1}}{x_{2} - y_{1}} = \frac{3 - (-1)}{-2 - (2)} = \frac{3 + 1}{-2 - 2} = \frac{4}{-4}$$

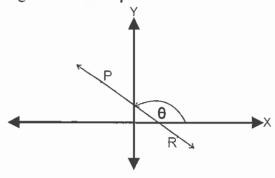

$$\therefore m_{M} = -1$$

	<u>.</u>
<del></del>	
	_
	<u>_</u>

#### C1.1.2 Application of the gradient:

- \* Parallel lines have the same gradients: If  $m_1 = m_2 \Leftrightarrow$  the lines are parallel.
- \* The product of the gradients of perpendicular lines is equal to -1 : If  $m_1 \times m_2 = -1 \iff$  the lines are perpendicular.
- \* Three or more points are collinear if the points lie on the same straight line.
  - $\therefore$  m<sub>AB</sub> = m<sub>BC</sub>  $\Leftrightarrow$  points A, B and C lies on the same straight line.
- \* The angle of inclination is the angle between the straight line and the positive x-axis:

The angle of inclination above is  $\theta$  and it is an acute angle (0° <  $\theta$  < 90°), if the line has a positive gradient.

The angle of inclination above is  $\theta$  and it is an obtuse angle (90° <  $\theta$  < 180°), if the line has a negative gradient.

To calculate the angle of inclination:  $\tan \theta = m_{PR}$ 

E.g.3 Consider: P(-3; -2), Q(5; 4) and R(1; -4)

- (a) Determine whether the points are collinear.
- (b) Prove that  $QR \perp PR$ .
- (c) Calculate the angle of inclination (correct to 2 decimals) of line PQ.

(a) 
$$m_{PQ} = \frac{y_Q - y_P}{x_Q - x_P} = \frac{4 - (-2)}{5 - (-3)} = \frac{4 + 2}{5 + 3} = \frac{6}{8} = \frac{3}{4}$$

$$m_{QR} = \frac{y_R - y_Q}{x_R - x_Q} = \frac{-4 - 4}{1 - 5} = \frac{-8}{-4} = 2$$

- $\therefore$  P, Q and R is not collinear, because  $m_{PQ} \neq m_{QR}$
- (b) We calculated in (a) that  $m_{OR} = 2$

$$m_{PR} = \frac{y_R - y_P}{x_R - x_P} = \frac{-4 - (-2)}{1 - (-3)} = \frac{-4 + 2}{1 + 3} = \frac{-2}{4} = \frac{-1}{2}$$

$$\therefore m_{QR} \times m_{PR} = \frac{2}{1} \times \frac{-1}{2} = -1$$

- $\therefore QR \perp PR$
- (c) We calculated in (a) that  $m_{PQ} = \frac{3}{4}$

$$\therefore \tan \theta = \frac{3}{4}$$

$$\therefore \quad \theta = 36.87^{\circ}$$

#### C1.2 Distance between two points:

#### Derivation of a formula for the distance between any two coordinates:

The coordinates of C will be  $(x_2; y_1)$  because A and C have the same x-coordinates and B and C have the same y-coordinates. The length of BC is the difference between the two x-coordinates of B and C and the length of AC is the difference between the v-coordinates of A and C.

E.g.4 Calculate the distance between S(7; -5) and T(4; -2). If necessary, write your answer as a simple surd. \*\*\*\*\*

$$x_1 \ y_1 \ x_2 \ y_2$$
  
S(7; -5) and T(4; -2)

$$d(ST) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$d(ST) = \sqrt{[(4) - (7)]^2 + [(-2) - (-5)]^2}$$

$$d(ST) = \sqrt{(4 - 7)^2 + (-2 + 5)^2}$$

$$d(ST) = \sqrt{(-3)^2 + (3)^2}$$
$$d(ST) = \sqrt{9 + 9}$$

$$d(ST) = \sqrt{18}$$

$$d(ST) = \sqrt{9 \times 2}$$

$$d(ST) = 3\sqrt{2}$$

Empresion	$\alpha$ .
Exercise	Z:

Date:

(1) Calculate the distance between P and Q in each of the following. If necessary, round off, correct to two decimals:

(a) P(2;5) and Q(7;4)

(b) P(-2;-1) and Q(0;5) (c) P(-3;1) and Q(-3;13)

# C1.3 Mid-point of a line segment:

E.g.5 Calculate the mid-point of line segment PQ with P(-4; 5) and Q(2; -1).

The mid-point of PQ, M, will be precisely halfway between P and Q. The x-coordinate of M will be precisely in the middle of the x-coordinates of P and Q and the y-coordinates of M will be precisely in the middle of the y-coordinates of P and Q.

$$\therefore M_x = \frac{-2+4}{2} = \frac{2}{2} = \underline{1}$$
and  $M_y = \frac{-3+5}{2} = \frac{2}{2} = \underline{1}$ 

$$\therefore \underline{M} = (1; \underline{1})$$

#### Deduction of a formula for the mid-point of any line section between two coordinates:

The mid-point M of line AB lies exactly halfway between A and B.

.: M's x-coordinate lies exactly halfway between the x-coordinates of A and B and M's y-coordinate lies exactly halfway between A and B's y-coordinates.

$$\therefore M = \left(\frac{x_1 + x_2}{2} : \frac{y_1 + y_2}{2}\right)$$

E.g.6 Calculate the mid-point between R(-3; 2) and T(-4; 8).

$$x_1 \ y_1 \ x_2 \ y_2$$
  
R(-3; 2) and T(-4; 8).

$$\therefore M = \left(\frac{x_1 + x_2}{2} : \frac{y_1 + y_2}{2}\right) = \left(\frac{-3 + (-4)}{2} : \frac{2 + 8}{2}\right) = \left(\frac{-3 - 4}{2} : \frac{10}{2}\right)$$

$$\therefore M = \left(\frac{-7}{2}; 5\right) \qquad or \qquad \left(-3\frac{1}{2}; 5\right)$$

Exercise 3:

Date:\_\_\_\_

(1) Calculate the mid-point of each of the following line segments:

(a) A(-2; 4) and B(-6; 4)

(b) C(-2; 0) and D(0; 2)

(c) I(-2; -7) and J(2; 1)

(d) K(5; 1) and L(11; 1)
