$$\begin{aligned} \rightarrow f(x+h) &= 1 - 3(x+h)^2 \\ &= 1 - 3(x^2 + 2xh + h^2) \\ \therefore f(x+h) &= 1 - 3x^2 + 6xh - 3h^2 \end{aligned}$$

Maar  $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

- (c) Bereken die koördinate van die draaipunte van  $f$ .  $\rightarrow f'(x) = 0$  (6)

$$\begin{aligned} f'(x) &= -3x^2 - 2x + 1 = 0 \quad \checkmark \checkmark \\ \therefore 3x^2 + 2x - 1 &= 0 \\ \therefore (x + 1)(3x - 1) &= 0 \quad \checkmark \\ \therefore x = -1 &\quad \text{of} \quad \checkmark \quad x = \frac{1}{3} \\ \therefore f(-1) &= -(-1)^3 - (-1)^2 + (-1) + 10 & f\left(\frac{1}{3}\right) &= -\left(\frac{1}{3}\right)^3 - \left(\frac{1}{3}\right)^2 + \left(\frac{1}{3}\right) + 10 \\ \therefore f(-1) &= 9 \rightarrow (-1; 9) \quad \checkmark & f\left(\frac{1}{3}\right) &= \frac{275}{27} \rightarrow \left(\frac{1}{3}; \frac{275}{27}\right) \quad \checkmark \end{aligned}$$

- (3) 'n Reghoekige houer word op so 'n manier vervaardig dat die lengte ( $l$ ) van die basis drie keer langer as die breedte is. Die material wat gebruik word om die bokant en die basis van die houer te vervaardig, kos R100 per vierkante meter. Die material wat gebruik word om die kante van die houer te vervaardig kos R50 per vierkante meter. Die houer moet 'n volume van  $9 \text{ m}^3$  hê. Laat die breedte van die houer  $x$  meter wees.

- (a) Bepaal 'n uitdrukking vir die hoogte ( $h$ ) van die houer in terme van  $x$ . (3)

$$\text{Volume} = L \times B \times H$$

$$\therefore 9 = 3x \times x \times h \rightarrow \text{Lengte is drie keer die breedte gegee} \checkmark$$

$$\therefore 9 = 3x^2 \times h \checkmark$$

$$\therefore h = \frac{9}{3x^2} = \frac{3}{x^2} \checkmark$$

- (b) Dui aan dat die koste om die houer te vervaardig as  $K = \frac{1200}{x} + 600x^2$  uitgedruk kan word. (3)

$$\text{BO} = \text{Basis} + \text{Bokant} + 4 \text{ sykante}$$

$$\text{BO} = [3x \times x + 3x \times x] + [2 \times 3xh + 2 \times xh] \checkmark \rightarrow \text{Sien skets bo!}$$

$$\therefore K = [2 \times 3x^2] \times 100 + [6xh + 2xh] \times 50$$

$$\therefore K = 600x^2 + 400xh \checkmark$$

$$\therefore K = 600x^2 + 400x \times \left(\frac{3}{x^2}\right) \checkmark \rightarrow \text{Sien (a)}$$

$$\therefore K = 600x^2 + \frac{400x \times 3}{x^2}$$

$$\therefore K = 600x^2 + \frac{1200}{x}$$
